

CSD87351Q5D 同步降压 NexFET™ 电源块

1 特性

- 半桥电源块
- 电流 20A 时，系统效率达到 90%
- 高达 32A 的运行电流
- 高频工作（高达 1.5MHz）
- 高密度 SON 5mm × 6mm 封装
- 针对 5V 栅极驱动进行了优化
- 开关损耗较低
- 超低电感封装
- 符合 RoHS 标准
- 无卤素
- 无铅引脚镀层

2 应用范围

- 同步降压转换器
 - 高频 应用
 - 高电流、低占空比 应用
- 多相位同步降压转换器
- 负载点 (POL) 直流 - 直流转换器
- IMVP、VRM 和 VRD 应用

典型电路

3 说明

此CSD87351Q5D NexFET™电源块是面向同步降压应用的优化设计方案，能够以 5mm × 6mm 的小巧外形提供高电流、高效率以及高频率性能。该产品针对 5V 栅极驱动应用进行了优化，可提供一套灵活的解决方案，在与来自外部控制器/驱动器的任一 5V 栅极驱动配套使用时，均可提供高密度电源。

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision D (January 2012) to Revision E	Page
• Added note for I_{DM} in the <i>Absolute Maximum Ratings</i> table	3
• Changed part number in Figure 32	13
• 已添加 器件和文档支持部分	17

Changes from Revision C (October 2011) to Revision D	Page
• 添加了特性项目：高达 32A 的运行电流	1

Changes from Revision B (September 2011) to Revision C	Page
• 将“DIM a”以毫米为单位的最大值由 1.55 更改为 1.5，将以英寸为单位的最大值由 0.061 更改为 0.059	18

Changes from Revision A (August 2011) to Revision B	Page
• Remove $Z_{DS(on)}$ Max	4
• Remove $Z_{DS(on)}$ Max	12
• Added Electrical Performance bullet	15

Changes from Original (March 2011) to Revision A	Page
• Replaced $R_{DS(on)}$ with $Z_{DS(on)}$	4
• Added Equivalent System Performance section	10

5 Specifications

5.1 Absolute Maximum Ratings

 $T_A = 25^\circ\text{C}$ (unless otherwise noted)⁽¹⁾

PARAMETER		CONDITIONS	MIN	MAX	UNIT
Voltage	V _{IN} to P _{GND}		−0.8	30	V
	T _G to T _{GR}		−8	10	
	B _G to P _{GND}		−8	10	
I _{DM} ⁽²⁾	Pulsed current rating		96		A
P _D	Power dissipation		12		W
E _{AS}	Avalanche energy	Sync FET, I _D = 87 A, L = 0.1 mH	378		mJ
		Control FET, I _D = 44 A, L = 0.1 mH	87		
T _J	Operating junction		−55	150	°C
T _{STG}	Storage temperature		−55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Pulse duration $\leq 50\text{ }\mu\text{s}$. Duty cycle $\leq 0.01\%$.

5.2 Recommended Operating Conditions

 $T_A = 25^\circ\text{C}$ (unless otherwise noted)

PARAMETER		CONDITIONS	MIN	MAX	UNIT
V_{GS}	Gate drive voltage		4.5	8	V
V_{IN}	Input supply voltage			27	V
f_{SW}	Switching frequency	$C_{BST} = 0.1\text{ }\mu\text{F}$ (min)	200	1500	kHz
	Operating current			32	A
T_J	Operating temperature			125	$^\circ\text{C}$

5.3 Power Block Performance

 $T_A = 25^\circ\text{C}$ (unless otherwise noted)

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNIT
$P_{LOSS}^{(1)}$	Power loss	$V_{IN} = 12\text{ V}$, $V_{GS} = 5\text{ V}$, $V_{OUT} = 1.3\text{ V}$, $I_{OUT} = 20\text{ A}$, $f_{SW} = 500\text{ kHz}$, $L_{OUT} = 0.3\text{ }\mu\text{H}$, $T_J = 25^\circ\text{C}$		2.5		W
I_{QVIN}	V_{IN} quiescent current	T_G to $T_{GR} = 0\text{ V}$ B_G to $P_{GND} = 0\text{ V}$		10		μA

- (1) Measurement made with six 10- μF (TDK C3216X5R1C106KT or equivalent) ceramic capacitors placed across V_{IN} to P_{GND} pins and using a high-current 5-V driver IC.

5.4 Thermal Information

 $T_A = 25^\circ\text{C}$ (unless otherwise stated)

THERMAL METRIC		MIN	TYP	MAX	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance (min Cu) ⁽¹⁾⁽²⁾			119	$^\circ\text{C/W}$
	Junction-to-ambient thermal resistance (max Cu) ⁽¹⁾⁽²⁾			62	
$R_{\theta JC}$	Junction-to-case thermal resistance (top of package) ⁽²⁾			25	$^\circ\text{C/W}$
	Junction-to-case thermal resistance (P_{GND} pin) ⁽²⁾			2.3	

- (1) Device mounted on FR4 material with 1-in² (6.45-cm²) Cu.
- (2) $R_{\theta JC}$ is determined with the device mounted on a 1-in² (6.45-cm²), 2-oz (0.071-mm) thick Cu pad on a 1.5-in $\times$ 1.5-in (3.81-cm $\times$ 3.81-cm), 0.06-in (1.52-mm) thick FR4 board. $R_{\theta JC}$ is specified by design while $R_{\theta JA}$ is determined by the user's board design.

5.5 Electrical Characteristics

$T_A = 25^\circ\text{C}$ (unless otherwise stated)

6 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

6.1 Application Information

6.1.1 Equivalent System Performance

Many of today's high-performance computing systems require low-power consumption in an effort to reduce system operating temperatures and improve overall system efficiency. This has created a major emphasis on improving the conversion efficiency of today's synchronous buck topology. In particular, there has been an emphasis in improving the performance of the critical power semiconductor in the power stage of this application (see [Figure 28](#)). As such, optimization of the power semiconductors in these applications, needs to go beyond simply reducing $R_{DS(ON)}$.

Figure 28. Equivalent System Schematic

The CSD87351Q5D is part of TI's power block product family which is a highly optimized product for use in a synchronous buck topology requiring high current, high efficiency, and high frequency. It incorporates TI's latest generation silicon which has been optimized for switching performance, as well as minimizing losses associated with Q_{GD} , Q_{GS} , and Q_{RR} . Furthermore, TI's patented packaging technology has minimized losses by nearly eliminating parasitic elements between the control FET and sync FET connections (see [Figure 29](#)). A key challenge solved by TI's patented packaging technology is the system level impact of Common Source Inductance (CSI). CSI greatly impedes the switching characteristics of any MOSFET which in turn increases switching losses and reduces system efficiency. As a result, the effects of CSI need to be considered during the MOSFET selection process. In addition, standard MOSFET switching loss equations used to predict system efficiency need to be modified in order to account for the effects of CSI. Further details behind the effects of CSI and modification of switching loss equations are outlined in [Power Loss Calculation With Common Source Inductance Consideration for Synchronous Buck Converters](#) (SLPA009).

Application Information (continued)

Figure 29. Elimination of Parasitic Inductances

The combination of TI's latest generation silicon and optimized packaging technology has created a benchmarking solution that outperforms industry standard MOSFET chipsets of similar $R_{DS(ON)}$ and MOSFET chipsets with lower $R_{DS(ON)}$. [Figure 30](#) and [Figure 31](#) compare the efficiency and power loss performance of the CSD87351Q5D versus industry standard MOSFET chipsets commonly used in this type of application. This comparison purely focuses on the efficiency and generated loss of the power semiconductors only. The performance of CSD87351Q5D clearly highlights the importance of considering the effective AC on-impedance ($Z_{DS(ON)}$) during the MOSFET selection process of any new design. Simply normalizing to traditional MOSFET $R_{DS(ON)}$ specifications is not an indicator of the actual in-circuit performance when using TI's power block technology.

Figure 30. Efficiency

Figure 31. Power Loss

Application Information (continued)

The chart below compares the traditional DC measured $R_{DS(ON)}$ of CSD87351Q5D versus its $Z_{DS(ON)}$. This comparison takes into account the improved efficiency associated with TI's patented packaging technology. As such, when comparing TI's power block products to individually packaged discrete MOSFETs or dual MOSFETs in a standard package, the in-circuit switching performance of the solution must be considered. In this example, individually packaged discrete MOSFETs or dual MOSFETs in a standard package would need to have DC measured $R_{DS(ON)}$ values that are equivalent to CSD87351Q5D's $Z_{DS(ON)}$ value in order to have the same efficiency performance at full load. Mid to light-load efficiency will still be lower with individually packaged discrete MOSFETs or dual MOSFETs in a standard package.

Table 1. Comparison of $R_{DS(ON)}$ vs $Z_{DS(ON)}$

PARAMETER	HS		LS	
	TYP	MAX	TYP	MAX
Effective AC on-impedance $Z_{DS(ON)}$ ($V_{GS} = 5\text{ V}$)	7.4	–	1.6	–
DC measured $R_{DS(ON)}$ ($V_{GS} = 4.5\text{ V}$)	7.4	8.8	2.6	3.1

The CSD87351Q5D NexFET™ power block is an optimized design for synchronous buck applications using 5-V gate drive. The control FET and sync FET silicon are parametrically tuned to yield the lowest power loss and highest system efficiency. As a result, a new rating method is needed which is tailored towards a more systems-centric environment. System-level performance curves such as power loss, Safe Operating Area (SOA), and normalized graphs allow engineers to predict the product performance in the actual application.

6.1.2 Power Loss Curves

MOSFET centric parameters such as $R_{DS(ON)}$ and Q_{gd} are needed to estimate the loss generated by the devices. In an effort to simplify the design process for engineers, Texas Instruments has provided measured power loss performance curves. [Figure 1](#) plots the power loss of the CSD87351Q5D as a function of load current. This curve is measured by configuring and running the CSD87351Q5D as it would be in the final application (see [Figure 32](#)). The measured power loss is the CSD87351Q5D loss and consists of both input conversion loss and gate drive loss. [Equation 1](#) is used to generate the power loss curve.

$$\text{Power loss} = (V_{IN} \times I_{IN}) + (V_{DD} \times I_{DD}) - (V_{SW_AVG} \times I_{OUT}) \quad (1)$$

The power loss curve in [Figure 1](#) is measured at the maximum recommended junction temperatures of 125°C under isothermal test conditions.

6.1.3 Safe Operating Area (SOA) Curves

The SOA curves in the CSD87351Q5D data sheet provides guidance on the temperature boundaries within an operating system by incorporating the thermal resistance and system power loss. [Figure 3](#) to [Figure 5](#) outline the temperature and airflow conditions required for a given load current. The area under the curve dictates the safe operating area. All the curves are based on measurements made on a PCB design with dimensions of 4 in (W) × 3.5 in (L) × 0.062 in (T) and 6 copper layers of 1-oz copper thickness.

6.1.4 Normalized Curves

The normalized curves in the CSD87351Q5D data sheet provides guidance on the power loss and SOA adjustments based on their application specific needs. These curves show how the power loss and SOA boundaries will adjust for a given set of systems conditions. The primary Y-axis is the normalized change in power loss and the secondary Y-axis is the change in system temperature required in order to comply with the SOA curve. The change in power loss is a multiplier for the power loss curve and the change in temperature is subtracted from the SOA curve.

6.2 Typical Application

Figure 32. Typical Application

6.2.1 Calculating Power Loss and SOA

The user can estimate product loss and SOA boundaries by arithmetic means (see [Design Example](#)). Though the power loss and SOA curves in this data sheet are taken for a specific set of test conditions, the following procedure will outline the steps the user should take to predict product performance for any set of system conditions.

6.2.1.1 Design Example

Operating conditions:

- Output current = 25 A
- Input voltage = 7 V
- Output voltage = 1 V
- Switching frequency = 800 kHz
- Inductor = 0.2 μ H

6.2.1.2 Calculating Power Loss

- Power loss at 25 A = 3.5 W ([Figure 1](#))
- Normalized power loss for input voltage ≈ 1.07 ([Figure 7](#))
- Normalized power loss for output voltage ≈ 0.95 ([Figure 8](#))
- Normalized power loss for switching frequency ≈ 1.11 ([Figure 6](#))
- Normalized power loss for output inductor ≈ 1.07 ([Figure 9](#))
- **Final calculated power loss = $3.5 \text{ W} \times 1.07 \times 0.95 \times 1.11 \times 1.07 \approx 4.23 \text{ W}$**

6.2.1.3 Calculating SOA Adjustments

- SOA adjustment for input voltage $\approx 2^\circ\text{C}$ ([Figure 7](#))
- SOA adjustment for output voltage $\approx -1.3^\circ\text{C}$ ([Figure 8](#))
- SOA adjustment for switching frequency $\approx 2.8^\circ\text{C}$ ([Figure 6](#))
- SOA adjustment for output inductor $\approx 1.6^\circ\text{C}$ ([Figure 9](#))
- **Final calculated SOA adjustment = $2 + (-1.3) + 2.8 + 1.6 \approx 5.1^\circ\text{C}$**

Typical Application (continued)

In the design example above, the estimated power loss of the CSD87351Q5D would increase to 4.23 W. In addition, the maximum allowable board and/or ambient temperature would have to decrease by 5.1°C. [Figure 33](#) graphically shows how the SOA curve would be adjusted accordingly.

1. Start by drawing a horizontal line from the application current to the SOA curve.
2. Draw a vertical line from the SOA curve intercept down to the board/ambient temperature.
3. Adjust the SOA board/ambient temperature by subtracting the temperature adjustment value.

In the design example, the SOA temperature adjustment yields a reduction in allowable board/ambient temperature of 5.1°C. In the event the adjustment value is a negative number, subtracting the negative number would yield an increase in allowable board/ambient temperature.

Figure 33. Power Block SOA

7 Layout

7.1 Layout Guidelines

There are two key system-level parameters that can be addressed with a proper PCB design: electrical and thermal performance. Properly optimizing the PCB layout will yield maximum performance in both areas. A brief description on how to address each parameter is provided.

7.1.1 Electrical Performance

The power block has the ability to switch voltages at rates greater than 10 kV/μs. Special care must be then taken with the PCB layout design and placement of the input capacitors, driver IC, and output inductor.

- The placement of the input capacitors relative to the power block's VIN and PGND pins should have the highest priority during the component placement routine. It is critical to minimize these node lengths. As such, ceramic input capacitors need to be placed as close as possible to the VIN and PGND pins (see [Figure 34](#)). The example in [Figure 34](#) uses 6, 10-μF ceramic capacitors (TDK part # C3216X5R1C106KT or equivalent). Notice there are ceramic capacitors on both sides of the board with an appropriate amount of vias interconnecting both layers. In terms of priority of placement next to the power block, C5, C7, C19, and C8 should follow in order.
- The driver IC should be placed relatively close to the power block gate pins. T_G and B_G should connect to the outputs of the driver IC. The T_{GR} pin serves as the return path of the high-side gate drive circuitry and should be connected to the phase pin of the IC (sometimes called LX, LL, SW, PH, etc.). The bootstrap capacitor for the driver IC will also connect to this pin.
- The switching node of the output inductor should be placed relatively close to the power block VSW pins. Minimizing the node length between these two components will reduce the PCB conduction losses and actually reduce the switching noise level.
- The switching node of the output inductor should be placed relatively close to the power block VSW pins. Minimizing the node length between these two components will reduce the PCB conduction losses and actually reduce the switching noise level. In the event the switch node waveform exhibits ringing that reaches undesirable levels, the use of a boost resistor or RC snubber can be an effective way to reduce the peak ring level. The recommended boost resistor value will range between 1 Ω to 4.7 Ω depending on the output characteristics of driver IC used in conjunction with the power block. The RC snubber values can range from 0.5 Ω to 2.2 Ω for the R and 330 pF to 2200 pF for the C. Refer to [Snubber Circuits: Theory , Design and Application](#) (SLUP100) for more details on how to properly tune the RC snubber values. The RC snubber should be placed as close as possible to the Vsw node and PGND see [Figure 34](#). ⁽¹⁾

7.1.2 Thermal Performance

The power block has the ability to utilize the GND planes as the primary thermal path. As such, the use of thermal vias is an effective way to pull away heat from the device and into the system board. Concerns of solder voids and manufacturability problems can be addressed by the use of three basic tactics to minimize the amount of solder attach that will wick down the via barrel:

- Intentionally space out the vias from each other to avoid a cluster of holes in a given area.
- Use the smallest drill size allowed in your design. The example in [Figure 34](#) uses vias with a 10-mil drill hole and a 16-mil capture pad.
- Tent the opposite side of the via with solder-mask.

In the end, the number and drill size of the thermal vias should align with the end user's PCB design rules and manufacturing capabilities.

9.4 Q5D 卷带信息

M0191-01

NOTES: 1. 10 链轮孔距累积容差为 ± 0.2

2. 每 100mm 长度的外倾角不能超过 1mm，在 250mm 长度上不累积。

3. 材料：黑色抗静电聚苯乙烯。

4. 全部尺寸单位为 mm，除非另外注明。

5. 厚度： 0.3 ± 0.05 mm。

6. 符合 MSL1 260°C（红外和对流）PbF 回流焊要求。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
CSD87351Q5D	ACTIVE	LSON-CLIP	DQY	8	2500	RoHS-Exempt & Green	NIPDAU SN	Level-1-260C-UNLIM	-55 to 150	87351D	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
CSD87351Q5D	LSON-CLIP	DQY	8	2500	330.0	15.4	5.3	6.3	1.2	8.0	12.0	Q2
